# Wireless Keyboards & Mice

**Why Logitech is the name to know. Batteries last months — sometimes years:** Logitech rates the K380 keyboard at 2 years on two AAA batteries, the M720 mouse at 24 months, and the MK540 keyboard at up to 36 months. **The tiny USB receiver just works:** plug the little receiver into a USB port and the keyboard or mouse connects instantly. Newer models use the Logi Bolt receiver (look for the lightning-bolt icon); older ones use Unifying (orange star icon). The two receivers do not mix, but Bluetooth works with everything. **One keyboard for several devices:** many Logitech models pair with three devices at once and switch between them with one keypress.

**The top picks. Logitech K380 — simplest keyboard:** small, quiet, and friendly — pairs with three devices and the batteries last about 2 years. **Logitech Ergo K860 — easiest on wrists:** a curved, split keyboard with a soft wrist rest — full-size, about 2 years of battery. **Logitech M720 Triathlon — best mouse:** a comfortable full-size mouse that switches between three devices, with a battery rated at 24 months. **Logitech MK540 — best keyboard-and-mouse set:** a familiar full-size keyboard with number pad, palm rest, and volume keys, plus a comfortable mouse — one receiver runs both, and the keyboard battery is rated up to 36 months.

**Setting one up, in plain words. Receiver models:** plug the tiny USB receiver into the computer — start typing. **Bluetooth models:** turn the keyboard or mouse on, hold its pairing button until the light blinks, then pick it from the Bluetooth list on your computer, tablet, or phone. **Batteries:** most Logitech models use AA or AAA batteries that last a year or more. When the pointer gets jumpy or keys start missing, change the batteries — do not buy a new mouse. **Rechargeable models:** plug them in overnight every few months.

**Card note:** if you already own an older Logitech with the orange-star Unifying receiver, new Logi Bolt devices will not pair to that receiver — use Bluetooth instead, or keep the new device's own receiver plugged in.

**When to call Sean instead.**

- Pairing a keyboard or mouse over Bluetooth when it will not show up.
- Choosing between models before you buy — hand size and wrist comfort matter.
- A wireless mouse that keeps freezing or disconnecting.
